

Q. 1 — Explain Workflow orchestration

Workflow orchestration is a method of organising pipelines to run in a usually ordered manner. Orchestration is defining in a data pipeline what components or tasks to run, in what order tasks are run, and when they should run. This also extends to handling failures and retries as well as sending alerts.

Orchestration fits in organising the different tasks in the ETL or ELT workflow. A common beginner mistake is to think that workflow orchestrators actually touches data. They don't; rather they just call tools doing this.

Q. 2 — Connect Workflow orchestration and Apache Airflow

Apache Airflow utilises components called DAGs (Directed Acyclic Graph) to orchestrate workflows. Workflow orchestration is the general concept of organising and executing tasks in a defined order while apache airflow is a tool to accomplish this using DAGs

Q. 5 — MCQ: Purpose of Workflow orchestration

Which statement best matches the lesson?

A. In plain words: Orchestration decides what should run, when it should run, and what is allowed to run next. Without orchestration, a team might start scripts manually or use separate

Q. 6 — MCQ: Applying Apache Airflow

What should the learner do before accepting a result involving Apache Airflow?

B. Verify the output against the requirement and retain evidence.

Q. 11 — MCQ: Purpose of Scheduler

Which statement best matches the lesson?

A. The scheduler decides when DAG runs should be created and which task instances are ready to run. If the webserver is running but the scheduler is not, the UI may open but scheduled

Q. 12 — MCQ: Applying Webserver and Airflow UI

What should the learner do before accepting a result involving Webserver and Airflow UI?

B. Verify the output against the requirement and retain evidence.

Q. 17 — MCQ: Purpose of Executor

Which statement best matches the lesson?

A. The executor controls how tasks are launched. For beginners, remember the responsibility rather than memorising every executor type: The scheduler decides what is ready.

Q. 18 — MCQ: Applying DAG

What should the learner do before accepting a result involving DAG?

B. Verify the output against the requirement and retain evidence.

Q. 23 — MCQ: Purpose of Operator

Which statement best matches the lesson?

A. An operator is a template used to create a task. Core distinction: Operator = task template.

Q. 24 — MCQ: Applying DAG file structure

What should the learner do before accepting a result involving DAG file structure?

B. Verify the output against the requirement and retain evidence.
